this textbook available in two volumes has been developed from a course taught at harvard over the last decade the

course covers principally the theory and physical applications of linear algebra and of the calculus of several variables particularly the exterior calculus the authors adopt the spiral method of teaching covering the same topic several times at increasing levels of sophistication and range of application thus the reader develops a deep intuitive understanding of the subject as a whole and an appreciation of the natural progression of ideas topics covered include many items previously dealt with at a much more advanced level such as algebraic topology introduced via the analysis of electrical networks exterior calculus lie derivatives and star operators which are applied to maxwell s equations and optics this then is a text which breaks new ground in presenting and applying sophisticated mathematics in an elementary setting any student interpreted in the widest sense with an interest in physics and mathematics will gain from its study
